### Table 3A: Summary of Selected Validated Screening and Assessment Tools for Post-Stroke Fatigue

This table provides a summary of the psychometric properties of a selected set of screening and assessment tools that have been validated for use in persons following stroke, or frequently reported in the stroke literature. This list is not exhaustive, rather it highlights the more commonly used and validated tools. It is recommended that these tools be considered as first line options for all stroke services.

| Fatigue Severity Scale (FSS) | 9 | Self-report Each item is scored on a scale from 1 (disagree) to 7 (agree) with each statement | 9-63 | Internal consistency: Nadarajah et al. 2017 found that the FSS had excellent internal consistency for both stroke patients and healthy controls (Cronbach’s α > 0.90). Likewise, Ozyemisci-Taskiran et al. (2019) found similar results with a Cronbach’s α or 0.93. Test-retest reliability: The FSS scale demonstrated excellent for both stroke and healthy controls with interclass coefficient (ICC) of 0.93 (95% CI: 0.88 to 0.96) and 0.93 (95% CI: 0.82 to 0.94), respectively. Criterion validity: Lerdal et al. (2011) found that the SFF has adequate criterion validity with a Cronbach’s α of 0.86. Concurrent Validity: Nadarajah et al. (2017) found that the FSS scale had good concurrent validity with the VAS-Fatigue (all r > 0.60, p < 0.01) and moderate validity with the SF36-vitality scale (r = 0.32, p = 0.02) | A score of ≥36 is suggestive of the need for further assessment | There are no studies examining the sensitivity and specificity of the FSS in the stroke population. Anton et al. found that among male patients with motor complete SCI in tertiary care, the area under the curve (AUC) was 0.80. Assuming a FSS cut-score of 4 to indicate significant fatigue and a WAS-F score of over 6 to indicate severe fatigue:  
- Sensitivity = 75%  
- Specificity = 67% |

<tr>
<td>Multidimensional Fatigue Symptom Inventory (MFSI)</td>
<td>83</td>
<td>Self report&lt;br&gt;Each item is rated on a 5-point scale indicating how true each statement was for the respondent during the last week (0=not at all; 4=extremely).</td>
<td>0-332</td>
<td><strong>Internal consistency:</strong> Among stroke patients, the MFSI demonstrated a Cronbach’s $\alpha$ of 0.91 and 0.93 for first and second interviews, respectively. (Mead et al. 2007)&lt;br&gt;<strong>Test-retest reliability:</strong> Among stroke patients, the MSFI demonstrated moderate to good test-retest reliability across scale items, with Kappa ($k$) ranging from 0.48 (95% CI: 0.27 to 0.69) to 0.69 (95% CI: 0.53 to 0.85) (Mead et al. 2007). For total score, the ICC was 0.76 (95% CI: 0.55 to 0.87)&lt;br&gt;<strong>Interrater reliability:</strong> Among stroke patients, The MSFI demonstrated very good interrater reliability across scale items with $k$ ranging from 0.82 (95% CI: 0.63 to 1.00) to 0.92 (95% CI: 0.83 to 1.00). For total score, the ICC was 0.88 (95% CI: 0.78 to 0.93)&lt;br&gt;<strong>Convergent construct validity:</strong> Among stroke patients, the convergent construct validity of the MFSI was high. The construct validity for MFSI was higher was when measured against the SF-36v2 ($r = -0.47$, $p &lt; 0.001$)</td>
<td>Higher scores indicate more fatigue</td>
<td>There are no studies examining the sensitivity and specificity of the MFSI in the stroke population. Stein et al. (1998) found that the MFSI was sensitive to fatigue, accurately discriminating cancer patients from control subjects and between patients with varying levels of performance status.</td>
</tr>
<tr>
<td>SF-36v2</td>
<td>36</td>
<td>35 items are rated on a Likert scale with varying number of response categories.&lt;br&gt;Vitality component is used to measure fatigue in stroke patients</td>
<td>0-100%</td>
<td><strong>Internal consistency:</strong> Among stroke patients, the SF36v2 demonstrated a Cronbach’s $\alpha$ of 0.76 and 0.78 for first and second interviews, respectively. (Mead et al. 2007)&lt;br&gt;<strong>Test-retest reliability:</strong> Among stroke patients, the SF36v2 demonstrated fair to moderate test-retest reliability across scale items, with $k$ ranging from 0.35 (95% CI: 0.07 to 0.63) to 0.47 (95% CI: 0.25 to 0.70) (Mead et al.2007). For total score, the ICC was 0.51 (95% CI: 0.27 to 0.69)</td>
<td>Higher vitality indicates less fatigue</td>
<td>There are no studies examining the sensitivity and specificity of the SF-36v2 in the stroke population.</td>

| Profile of Mood States-fatigue subscale (POMS-fatigue) | 7          | Self-report    | 0-28        | **Interrater reliability:** Among stroke patients, The SF36v2 demonstrated good to very good interrater reliability across scale items with $k$ ranging from 0.72 (85% CI: 0.45 to 0.99) to 0.89 (95% CI: 0.75 to 1.00). For total score, the ICC was 0.92 (95% CI: 0.86 to 0.96)  
**Convergent construct validity:** Among stroke patients, the convergent construct validity of the SF-36v2 was high. The construct validity was lower when compared against the FAS ($r = -0.41, p = 0.003$) and the MFSI ($r = -0.47, p < 0.001$) | Higher scores on the POMS-fatigue reflect a greater agreement with the mood state during the past week. | There are no studies examining the sensitivity and specificity of the FSS in the stroke population. |

> **Internal consistency:** Among stroke patients, the POMS-Fatigue demonstrated a Cronbach’s $\alpha$ of 0.89 and 0.88 for first and second interviews, respectively. (Mead et al. 2007)  
**Test-retest reliability:** Among stroke patients, the MSFI demonstrated moderate to good test-retest reliability across scale items, with Kappa ($k$) ranging from 0.45 (95% CI: 0.19 to 0.72) to 0.61 (95% CI: 0.42 to 0.80) (Mead et al. 2007). For total score, the ICC was 0.74 (95% CI: 0.56 to 0.85)  
**Interrater reliability:** Among stroke patients, The MSFI demonstrated good to very good interrater reliability across scale items with $k$ ranging from 0.71 (85% CI: 0.45 to 0.97) to 0.89 (95% CI: 0.75 to 1.00). For total score, the ICC was 0.84 (95% CI: 0.72 to 0.91)  
**Convergent construct validity:** Among stroke patients, the convergent construct validity of the POMS-fatigue was high. The construct validity was higher was

<td>FAS-3</td>
<td></td>
<td></td>
<td></td>
<td>Post hoc analysis of the scale among stroke patients found that 3 scale items were most predictive of fatigue: “I am bothered by fatigue”; “I get tired very quickly”; and “Physically, I feel exhausted.” The FAS-3 score was derived by aggregating the scores on these items. (Cummings et al. 2017)</td>
